 Video Lecture #3
 Finding the cost to power light bulbs and Defining Kilowatt Hour

\$0.12

Example Problem: 3 Light Bulbs; $P_f = 15$ watts; $P_i = 60$ watts; $\Delta V = 120$ V; $\frac{\$0.12}{kW \cdot hr}$

$\frac{3hr}{day}$ (Bulbs are powered for this much time)

(yes, there are 24 hours in a day, however, the light bulbs are not on 24 hours each day.)

(A standard household circuit in the United States has a potential difference of 120 V.)

$$\Delta P = P_f - P_i = 15 - 65 = -50 \text{ watts} \Rightarrow \|\Delta P\| = 50 \text{ watts}$$

$$\Delta V = IR \Rightarrow R = \frac{\Delta V}{I} = \frac{120}{I} = \text{?????} \text{ (we don't know the current.)}$$

$$P = \frac{\Delta V^2}{R} \Rightarrow R = \frac{\Delta V^2}{P} = \frac{120^2}{15} = \boxed{960\Omega}$$

$$\text{Power saved by three bulbs: } P_{\text{saved}} = 3 \times 50 = 150 \text{ watts} \times \frac{1kW}{1000\text{watts}} = 0.15kW$$

$$0.15kW \times \frac{3hr}{day} = \frac{0.45kW \cdot hr}{day} \Rightarrow \left(\frac{0.45kW \cdot hr}{day} \right) \left(\frac{\$0.12}{kW \cdot hr} \right) \left(\frac{365.242days}{1year} \right) = \frac{\$19.723}{year}$$

$$\$108 \times \frac{1year}{\$19.723} = 5.4758 \approx \boxed{5.5 \text{ years}}$$

What is a KiloWatt Hour?

$$(kW \cdot hr) \left(\frac{1000W}{1kW} \right) \left(\frac{3600s}{1hr} \right) = 3,600,000W \cdot s = 3,600,000 \frac{J}{s} \cdot s = 3,600,000s = 3.6MJ$$

$1kW \cdot hr = 3.6MJ$ (you will not be given this as a conversion, you must derive it, every time.)
